

General Info

- Most participants were influenced to download list apps based on how simple it appeared to be before downloading
 - If they can develop a list quickly, they will keep using it.
- Some participants found their apps most useful before shopping, some in the store
 - **One participant found it less useful before shopping, because they use a whiteboard to accumulate items on a list (then transfer to an app later)
 - *^Is this a barrier to entry for some people who would use the app in-store but not always for planning during the week?*
- List apps are helpful because they help with remembering items in the store

Shopping Behavior

- Participants usually split grocery shopping with their spouses or partner -- not always going to the store together, but collaborating in making the list while one makes the shopping trip
- List apps are used when they are convenient
- Participants go to the store at varying frequencies, but on average go 1-2x/week
- Most shoppers go to multiple stores in order to get all of their items -- certain stores are better for certain items
 - At the same time, most shoppers will have one store where they get most of their items and pantry staples (larger store like Meijer or Kroger)

Store Experience

- The app will be very helpful if it can help to make it easier to make decisions in the store
 - decisions about navigating the store aisles, or about which item to get
- Crossing off items needs to be optimized for usability, since it is the main feature of the in-store experience.
 - do not delete or move items once crossed off
 - Be able to see what your collaborator has crossed off

App Experience

- Personalized, relevant ads improve shopping experience

- Tasty's disadvantage is that it only connects to Walmart
- Tasty's advantage is that it's rooted in recipe-content
- Flipp is difficult to use for creating a list and incorporating the deals within the app
- Start with simple, self explanatory features that come natural to users, and slowly add more complex features once more comfortable.

Other Apps

- Twitter is easy to use and entertaining, which keeps users coming back to it.
 - Familiar and better when features are fun but simple
- Kroger app was easy to use because allowed for customization and online shopping
- Facebook is too political
- PeaPod is good because you could order groceries online for delivery, and it saved orders like it was maintaining a grocery list
 - Closely matched the in-store experience, enhanced the overall grocery shopping experience as something new for customers, especially those who are busy
- Participants didn't use the Notes app because of the lack of collaboration abilities, and to keep notes separate from grocery list things -- list apps offer more anyways
- TikTok is good because of the constant stream of information without other distractions
 - Best way to learn how to use the app was from conversations with other users, comment sections

List Organization

- Some found it more convenient to create one list for specific items at different retailers, or to keep one ongoing list than creating and sharing a new list every time.
- Using pen and paper can be easier to use at home during the week.
- Referencing a list on a phone can be more convenient than pen and paper.
- Users tend to follow recipes that are familiar to them.
- The ability to create more than one list can be difficult for some app users, and should allow for quick list adds and easy list creation.
- Users seek meal or recipe inspiration that they can loosely follow and add items to list based on those ideas.
- Lists and shopping trips can be planned around recipes.
- Users value the option to manually input plain text for list items (ie. butter) but also like the ability to select a populated suggestion (ie. land o lakes salted butter sticks 16 oz.)

New Features

- Participants' ideas for new features revolved around simple solutions that both helped them when planning the list (ex. circulars, customized ads, sharing/family) and in the store (inventory, prices, item specifics)
- Other methods for building grocery lists are preferred when they are more accessible or convenient, or fit current routine
- It would be helpful to be able to import lists or receive recipe inspiration directly from the list app

- Item recommendations should be based on what the user has bought or added to their list before (customized to them), or what's seasonal/in the marketplace
- Participants are motivated to go to different stores because they buy different items from different retailers. It would be helpful if the app could help them decide which store they should go to based on their list, the time of day, prices, deals, inventory.
- It would be helpful if the list app could give inventory info to help build the list with potential substitutions and/or to determine the best store to go to
- It would be helpful to include current loyalty cards in the app, or even a new type of loyalty program (like Fetch).
 - Deals are interesting, but it doesn't influence where shoppers buy as much. If participants use coupons, they can use the notes area of the list app for reminding themselves to use it in the store.
- Having a paid version of the app might influence people to use it more, "unlock" new features

Current Features

- Most users utilize and even depend on sharing capabilities for shopping with family in store.
- A group of participants explained categorizing within several apps could be improved. It can either be too much work, or auto-categorization can be inaccurate. However, a few participants did mention that some app's auto categorization is helpful.
- When it comes to organizing lists, participants were mixed in whether or not they organize their list. Some organize by department or store aisle/section, others organize by retailer. Few organize in other ways.
- Participants tend to check their pantry, fridge, or freezer for items they are running out of or for things they may need when adding things to a list.
- A few participants want a visual indicator or confirmation that changes to their list have been saved.
- When adding product quantities to a list, some app's can over complicate things. Users want a quick way to be able to differentiate the amount of an item they need that is simple and effective.

Usability

- Simplicity and ease of use are favored by participants
- Some features are unnecessary for what participants use the app for (list building)

Preliminary Requirements for MVP: What can be accomplished in 8 weeks of dev (maybe 10 weeks)

1. Sign up and log in (Google SSO or email?)
2. Ability to create and manage multiple lists (incl. Assigning list names)
3. Ability to cross off items without deleting them from a list
4. **Ability to share lists within the app, sync accurately (with confirmation of save/sync)**
5. Ability to search for items to add
6. Ability to add items to a list, delete items from list
7. Ability to add details to list items (quantities, notes...)
8. Ability to use with iOS or Android

Nice-to-have (Post 8-weeks):

1. Save previously shopped or frequently purchased items for easy access
2. Ability to import/paste multiple list items at once?????
3. Ability to un-cross all crossed off items of a list for repeat lists/items
4. Ability to receive recommendations/suggestions while searching for items
5. Support list creation with categorization for specific retailers within a parent list
6. Ability to share lists outside of the app (via Messages, plain text)
7. Ability to use on/off wifi
8. Parse text for list items from an image or URL

Force account creation before able to use app features

- Onboarding screen to sign up/sign in
-

Ask Ben/Jeramy next week during design review (after showing any work we have on user flow/screens) → who do we want to pull in for the backend? Get Tim involved for PMing here too?
