

List App Research

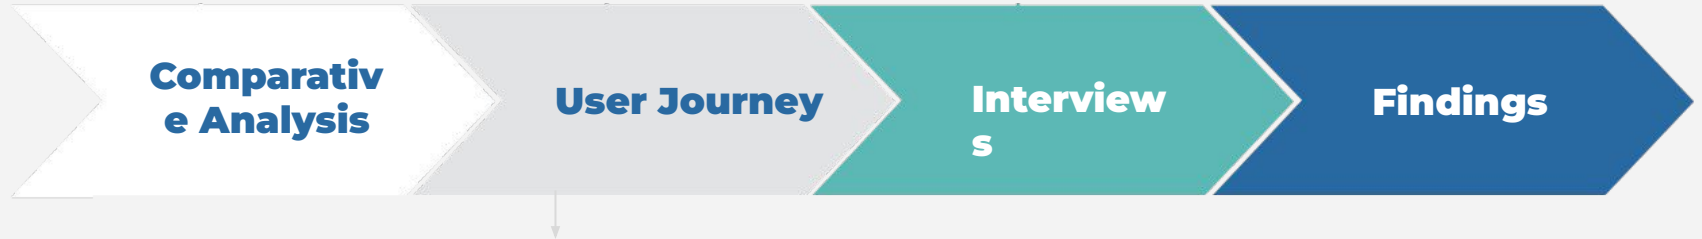

AdAdapted UX/UI

Overview

Research Process

Steps taken to gather information

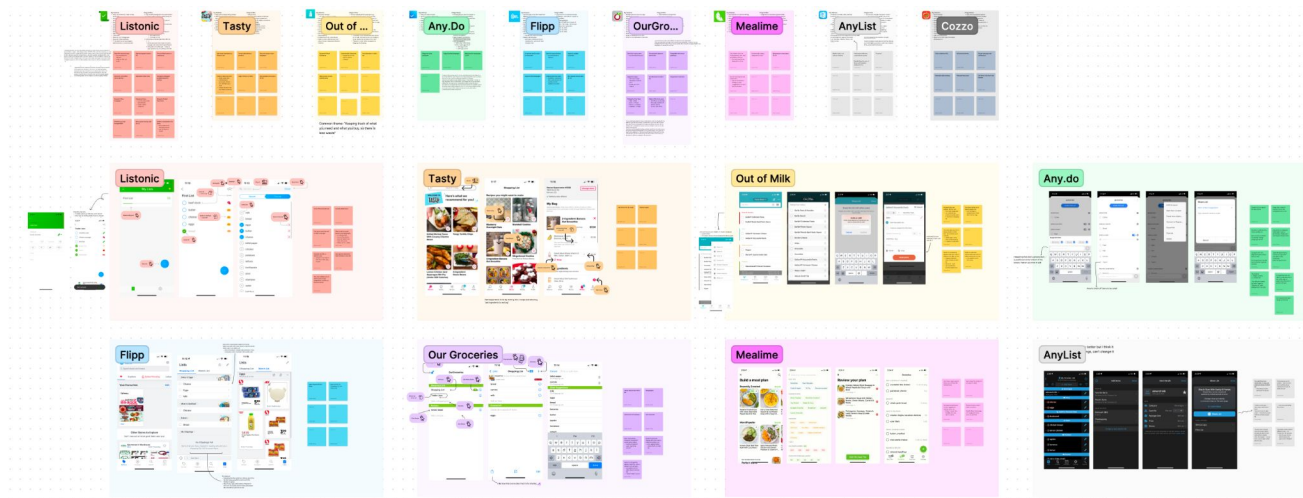

Comparative Analysis

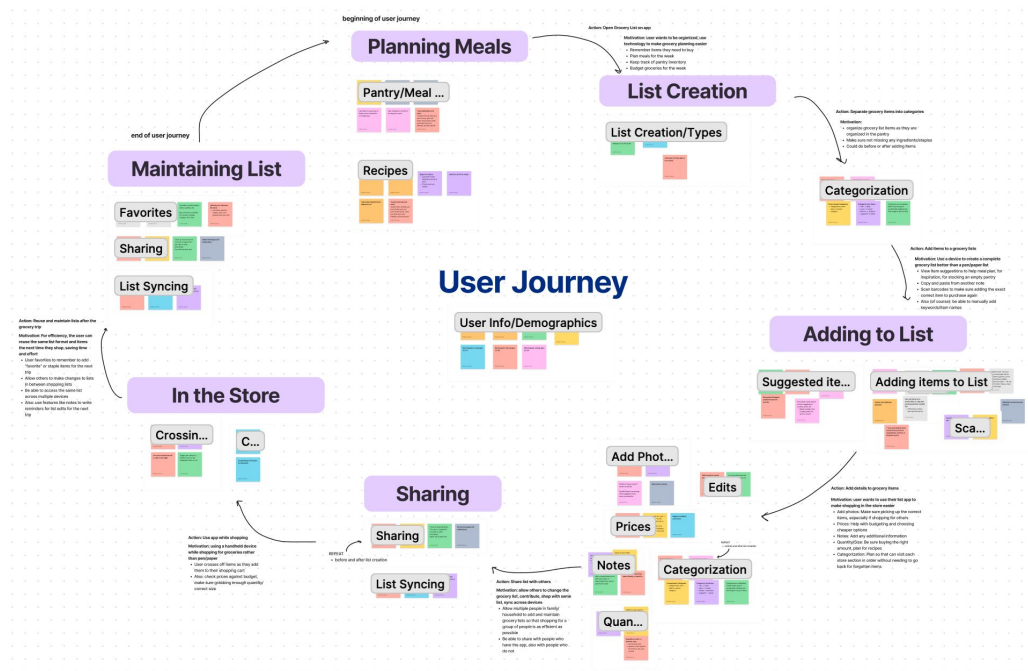

Understand competition, identify opportunities, and find an edge

Apps:

- Listonic
- Tasty
- Flipp
- OurGroceries
- Out of Milk
- Any.Do
- Mealime
- AnyList
- Habitica
- Pestle

- Planning Meals
 - Pantry/M Meal Planning
 - Recipes
- List Creation
 - Categorization
- Adding to List
- Sharing
- In the Store
- Maintaining List

Primary Research

Interviews

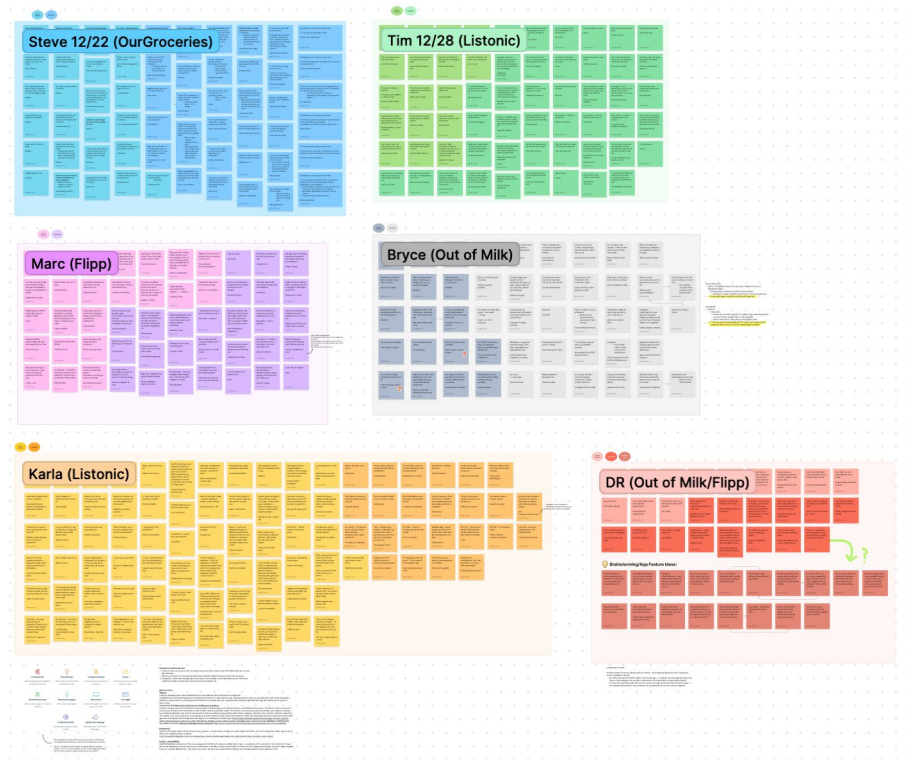

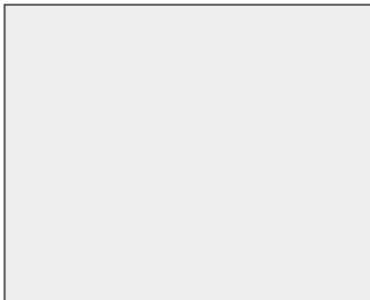

Gather research first-hand from list app users

Question Breakout:

- 2 Categories
 - General/Shopping Behavior
 - App Specific

Internal Interviewees:

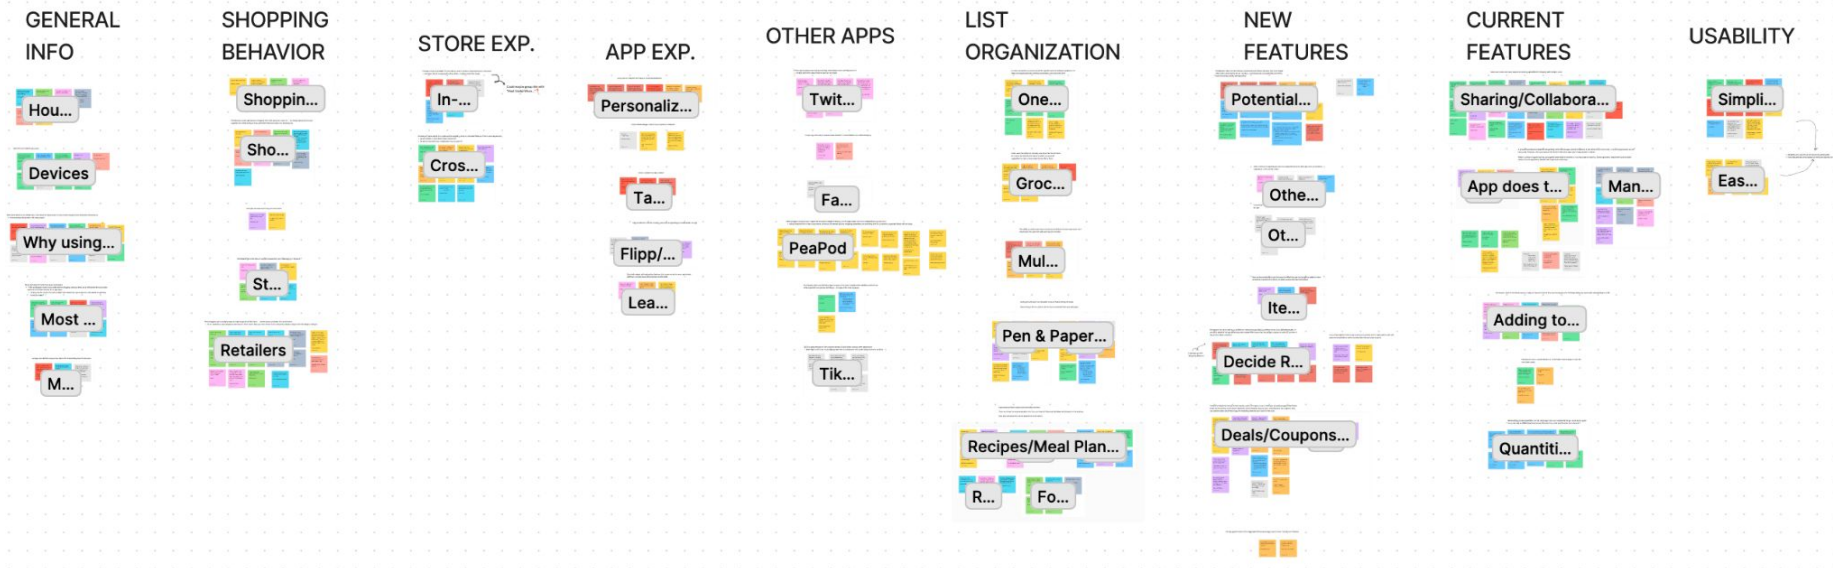

-
-
-
-
-
-

Primary Research

Affinity Diagram

Map findings from interviews into common themes

Issues with Current Apps

Things that improve overall experience or where users struggle to complete actions

List Sharing

- Users heavily rely on sharing between household members in store

Saving

- Users want to have a visual indicator that shows their changes have been saved (lack of trust)

Categorization

- Too much work for accurate categories
- Auto-categorization is inaccurate

Quantities

- Adding quantities to list items creates more work - needs to be simpler

"Bugged me when spices was going into dairy and then I had to fix it"

Categories not accurate

Maddie Graham

Better way to make that work – if there was some visual indicator that this has been updated or been saved

Confidence that saved

Maddie Graham

Key Findings

Interview Analysis and Common Themes

General Information

- Users influenced by simplicity & speed to create list

Shopping Behavior

- Most users split shopping with SO and utilize sharing
- Most users shop at 1-2 retailers minimum

Store Experience

- Crossing off is an area for improvement
- App = convenience

App Experience

- Use simple, unambiguous features
- Add more complex features slowly
- Closely match in-store experience

List Organization

- More convenient to create one list for multiple retailers or keep an ongoing list
- Creating multiple lists can be difficult across different apps

Feature Ideas and Brainstorming

Potential features from interviewees and research

Product Recommendations

- If I add “steak”, recommend potatoes or asparagus
- Without typing anything → suggest common or paired items

Product/Retailer Inventories*

- Allow users to verify if items are out of stock at preferred retailers

List Price at Retailers

- Show users where their list would be cheapest
- Deal finding for list items

Could suggest other retailers or substitutions if out of stock

Ex: recipe calls for 7 oz sour cream, suggest 8oz daisy container. if out of stock, suggest two 4-oz containers versus a 16oz container

Maddie Graham

*may not be feasible

Basic Requirements

Requirements for MVP, 8-10 weeks of development

1. Sign up and log in (Google SSO or email)
2. Ability to create and manage multiple lists (incl. Assigning list names)
3. Ability to cross off items without deleting them from a list
4. Ability to share lists within the app, sync accurately (with confirmation of save/sync)
5. Ability to search for items to add
6. Ability to add items to a list, delete items from list
7. Ability to add details to list items (quantities, notes...)
8. Ability to use with iOS or Android

Want to be able to cross
off and be able to renew
list easily

*Crossing off,
Renewing list*

Maddie Graham

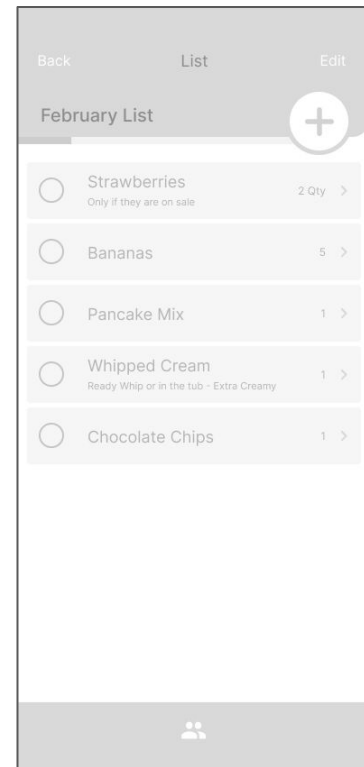

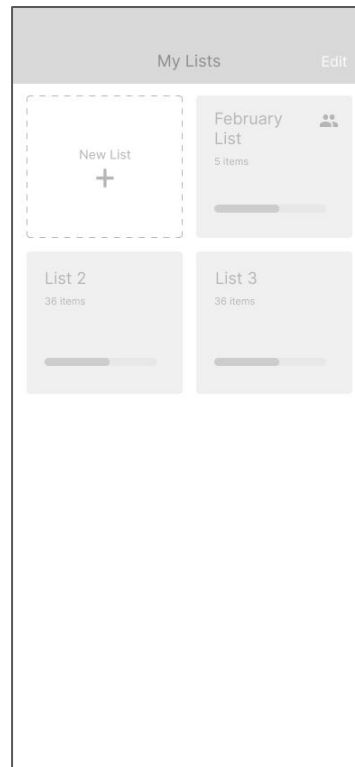

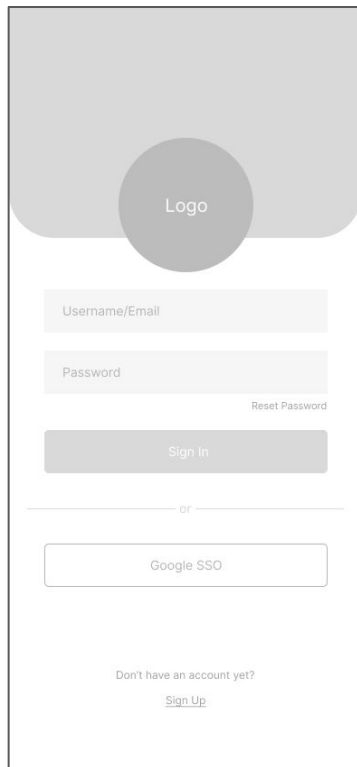

Post Research

Initial Prototype

Wireframing and iterating without color

What's Next

Additional brainstorming, MVP, Post-MVP

1. Save previously shopped or frequently purchased items for easy access
2. Ability to import/paste multiple list items at once*
3. Ability to un-cross all crossed off items of a list for repeat lists/items
4. Ability to receive recommendations/suggestions while searching for items
5. Support list creation with categorization for specific retailers within a parent list
6. Ability to share lists outside of the app (via Messages, plain text)
7. Ability to use on/off wifi
8. Parse text for list items from an image or URL

End
